SUMMARY

Backend engineer working on the parts of a logistics platform that have to stay correct when the network does not: event ingestion, idempotent replay, and the billing reconciliation that sits downstream of both.

EXPERIENCE

Senior Backend Engineer — Northwind Logistics Platform Ltd

2021–2024

Platform group, distributed team

- Rebuilt the ingestion path so that a replayed shipment event is idempotent, which removed the nightly reconciliation job entirely.
- Took the p99 of the quoting endpoint from 1.9s to 240ms by moving the tariff lookup behind a read-through cache.
- Wrote the migration runbook the team still uses for zero-downtime schema changes on the shipments table.

Backend Engineer, Distributed Systems — Meridian Data Services, Platform Reliability

2019–2021

Reliability track

- Owned the message bus consumers through a broker upgrade that changed delivery semantics under partition loss.
 - Introduced contract tests between the pricing and billing services, which caught three breaking changes before release.
-

SKILLS

- Services and storage: schema design, migrations, read-through caches, queue consumers with at-least-once delivery.
- Operations: tracing, structured logs, error budgets, and the runbooks that make an on-call rotation survivable.

EXPERIENCE, CONTINUED

Software Engineer — Cobalt Analytics

Bengaluru · 2017–2019

Analytics team

- Owned the message bus consumers through a broker upgrade that changed delivery semantics under partition loss.
 - Introduced contract tests between the pricing and billing services, which caught three breaking changes before release.
-

PROJECTS

The scheduling simulator behind the depot rota is published as Atlas, and the fixtures it runs against were contributed upstream.

A smaller tool, Ledger, reconciles the two billing exports.

Both are documented in the handbook alongside the deployment notes.

See the deployment runbook for more detail.

EDUCATION

B.E. Computer Science — Anytown Institute of Technology

2013–2017

Coursework in distributed systems and compilers; final year project on incremental query evaluation.
