

Drift sentinel

This one-page memo is converted once and frozen. Every live Google Docs run uploads the same bytes first and compares the export with the row recorded the first time, so a change on Google's side is seen as one.

A second paragraph gives the export a line pitch to keep: pages, word recall, words within two points and the median vertical drift are compared.

1. Pages must match exactly.
2. Recall and placement must stay inside a tight tolerance.
3. Drift is printed, recorded and the run continues.

Metric	Tolerance
pages	exact
word recall	0.005
within 2pt	0.02
dy p50	0.5pt
